STRUCTURAL DOCUMENT

INTEGRATED MODEL, HOLDING + INDEX + MLM + TOKEN DAO

February 11, 2026

1. Executive Summary

This document defines the structural and legal architecture of a hybrid business ecosystem that integrates institutional capital, technological infrastructure, a commercial network, and decentralized governance within a coherent and scalable corporate framework.

The model is composed of five clearly differentiated yet strategically aligned layers.

First, a corporate Holding, whose ownership is structured through a Security Token (ST) and the participation of an institutional fund. This layer represents the core of strategic control, corporate governance, and institutional direction of the project. The Holding does not interact with retail users nor distribute instruments to the general public; its function is exclusively corporate and supervisory.

Second, an Operating Company (OpCo) that acts as the executive arm of the ecosystem. The OpCo is responsible for technological development, commercial execution, administration of the Index Engine, and coordination of the MLM model. This entity materializes the strategy defined by the Holding and executes the operational decisions of the system.

Third, an Index Engine, conceived as the internal technological engine of the ecosystem. The Index does not constitute an investment fund nor a vehicle for managing third-party capital; its function is to optimize internal dynamics, manage technical parameters, coordinate incentives, and structure functional tools within the digital environment.

Fourth, a Multi-Level Marketing (MLM) system that operates as a structured commercial network for the distribution of memberships, access to tools, and ecosystem services. The MLM does not distribute financial instruments nor participate in investment schemes; its function is strictly commercial, based on the sale of real products and services within the environment.

Fifth, a Token DAO, designed as a utility and governance instrument that enables financing of ecosystem development and structured decentralized participation. This token does

not represent equity participation, does not grant proprietary rights over the Holding or the institutional fund, and does not constitute an investment instrument.

Finally, the model incorporates a Corporate Treasury whose function is to administer the capital raised to ensure ecosystem development, expansion, and operational sustainability. The Treasury operates as a corporate reserve and not as an investment fund for users.

Structural Principles of the Model

The architecture is built upon four fundamental principles.

Controlled Global Operation.
The ecosystem is designed to operate across multiple jurisdictions, excluding those where regulatory frameworks prevent the distribution of utility tokens or the implementation of the commercial model.

Absolute Separation Between Equity and Utility.
Institutional participation (ST + fund) remains completely isolated from the Token DAO and from retail users. This separation is structural, legal, and economic.

Non-Configuration as a Retail Investment Fund.
The model avoids pooling user capital with a proportional expectation of returns managed by third parties. The Treasury administers corporate capital, not capital economically belonging to token purchasers.

Limited Decentralized Governance Compatible with Corporate Structure.
The DAO introduces structured community participation mechanisms without replacing the corporate structure of the Holding or altering the legal responsibility of the Operating Company.

Strategic Objective

The central objective of the model is to create a sustainable ecosystem in which institutional capital supports the underlying infrastructure, the token finances and energizes expansion, the MLM drives commercial growth, the Index strengthens operational efficiency, and the Treasury ensures stability and continuity.

All of this is structured within an architecture designed to preserve legal clarity, economic coherence, and international scalability.

2. Equity Layer

The ownership layer constitutes the institutional core of the ecosystem and defines the structure of control, corporate governance, and economic rights over the Holding. This layer is fully separated from the Token DAO and from the retail environment, preserving a clear distinction between institutional capital and digital utility.

The Equity Layer is composed of two fundamental elements:

1. A Security Token (ST) representing equity participation in the Holding.
2. An institutional fund participating as a strategic investor within the Holding.

This structure ensures stability, strategic oversight, and long-term alignment without exposing the architecture to regulatory risks arising from the mixing of equity and utility.

2.1 Security Token (ST)

The Security Token represents the digitized fraction of equity ownership in the Holding. Its function is strictly corporate and limited to the institutional layer.

The ST grants:

- Economic rights over the Holding.
- Voting rights in accordance with corporate bylaws.
- Participation in strategic decisions.
- Rights to dividends, if applicable.
- Participation in corporate events (sale, merger, liquidation).

The ST is not:

- A utility token.
- An instrument distributed to retail.
- A token commercialized through the MLM.
- A mechanism to access the Index.
- An instrument linked to the Token DAO.

The issuance and transfer of the ST occur under private agreements, subject to applicable securities regulations, including transfer restrictions, institutional KYC requirements, and appropriate corporate documentation.

While the ST may be digitally represented for administrative efficiency, it legally retains its nature as a capital instrument.

2.2 Institutional Fund

The institutional fund participates as an investor within the Holding, contributing:

- Strategic capital.
- Financial oversight.
- Institutional credibility.
- Long-term alignment.
- Corporate discipline structure.

The fund does not interact with retail users nor with the Token DAO. Its relationship is exclusively with the Holding, and its participation is governed by private investment agreements.

The fund:

- Does not distribute products to retail.
- Does not raise capital through the MLM.
- Does not economically back the Token DAO.
- Does not guarantee returns to the retail ecosystem.

Its role is to strengthen the institutional layer, not to operate as an investment vehicle for users.

2.3 Holding Company

The Holding is the entity that owns the Operating Company and acts as:

- The strategic body.
- The center of corporate control.
- The supervisor of corporate compliance.
- The ultimate authority for structural decisions.

The Holding does not:

- Sell the Token DAO.
- Directly operate the MLM.
- Receive capital from retail users.
- Manage third-party investments on behalf of the public.

The Holding defines strategic guidelines, appoints the board, and supervises the execution carried out by the Operating Company.

2.4 Structural Separation Between Equity and Token DAO

One of the most relevant pillars of the model is the absolute separation between:

- The equity layer (ST + fund), and
- The utility layer (Token DAO).

This separation implies that:

- The Token DAO does not represent participation in the Holding.
- Token DAO holders do not have corporate rights.
- The Holding's performance is not distributed to Token DAO holders.
- The fund's growth does not automatically impact the value of the Token DAO.
- There is no conversion mechanism between ST and Token DAO.

This division protects the model from regulatory reclassification and maintains legal coherence between institutional capital and the digital ecosystem.

2.5 Strategic Function of the Equity Layer

The institutional layer fulfills five essential functions:

1. Providing structural stability.
2. Ensuring corporate discipline.
3. Aligning long-term strategic incentives.
4. Securing formal oversight and governance.
5. Protecting the ecosystem from operational improvisation.

Without this layer, the ecosystem would lack institutional anchoring; without proper separation, the model could face regulatory exposure.

3. Holding Company

The Holding Company represents the highest tier of the ecosystem's corporate architecture. Its function is strategic, corporate, and supervisory not operational or commercial. It acts as the parent entity that concentrates institutional ownership and defines the long-term direction of the project.

The Holding directly owns the Operating Company and, through it, maintains indirect control over the Index Engine, the MLM system, and the associated technological infrastructure. However, its role is not to execute daily operations, but to establish guidelines, approve structural decisions, and ensure strategic coherence.

3.1 Nature and Strategic Role

The Holding fulfills four primary functions:

Strategic Direction
It defines the long-term vision, expansion pathways, macro-level resource allocation, and the general orientation of the ecosystem.

Corporate Governance
It appoints the board of the Operating Company, establishes internal control policies, and oversees regulatory compliance and financial discipline.

Structural Protection of the Model
It ensures that all ecosystem layers (Index, MLM, Token DAO, and Treasury) operate within defined parameters, preserving the separation between institutional equity and utility token.

Relationship with Institutional Investors
It manages interactions with ST holders and the participating fund, ensuring transparency and strategic alignment.

3.2 Operational Limits of the Holding

It is fundamental to understand what the Holding does not do, as these boundaries protect the legal architecture of the model.

The Holding:

- Does not sell the Token DAO.
- Does not commercialize memberships.
- Does not distribute financial instruments to retail.
- Does not raise capital from end users.
- Does not administer funds belonging to third parties.
- Does not operate as a public investment vehicle.

This separation prevents the Holding from being exposed to liabilities arising from commercial activities or retail capital raising.

3.3 Relationship with the Operating Company

The Operating Company acts as the executive arm of the Holding. While the Holding defines the strategic and corporate framework, the OpCo executes:

- Technological development.
- Operation of the Index.
- Administration of the MLM.
- Implementation of Treasury decisions.
- Commercial management of the ecosystem.

The Holding retains supervisory authority but does not intervene in day-to-day operations except in structurally significant decisions.

3.4 Separation Between Holding and Token DAO

A key structural principle is that the Holding is not legally linked to the Token DAO as an ownership instrument.

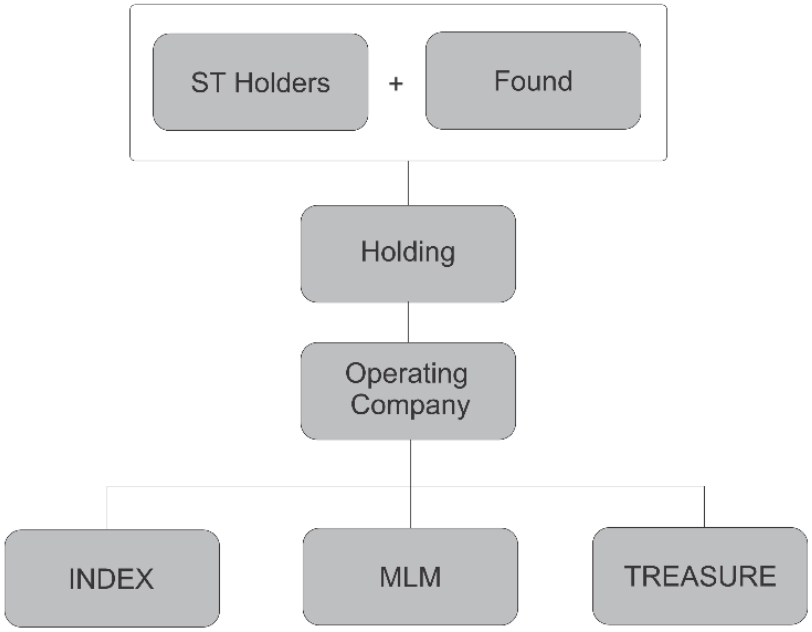
This implies that:

- Token DAO holders are not shareholders of the Holding.
- The Holding has no fiduciary obligation toward Token DAO holders.
- There is no automatic conversion between the Token DAO and the ST.
- The financial performance of the Holding does not determine economic rights of the Token DAO.

This separation is critical to prevent the token from being interpreted as a corporate participation instrument.

3.5 Position Within the General Architecture

Structurally, the Holding sits at the top tier of the model's hierarchy.



The Holding controls the structure but does not interact with the end user.

3.6 Stability Function

The existence of the Holding enables:

- Separation of operational risk from institutional risk.
- Attraction of sophisticated capital without mixing it with utility components.
- Strategic continuity over the long term.
- Facilitation of institutional audits and reporting.
- Protection of the ecosystem's intangible assets.

In the absence of this layer, the system would lose corporate coherence and become exposed to strategic misalignment and structural instability.

4. Operating Company (OpCo)

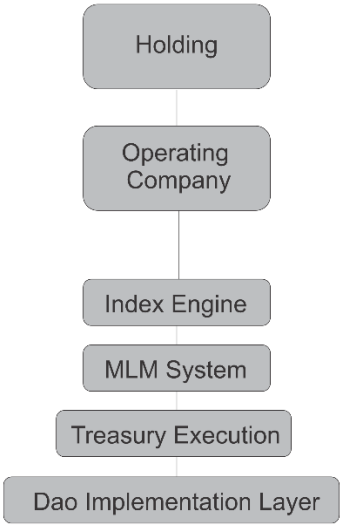
The Operating Company constitutes the executive arm of the ecosystem and is responsible for operationally materializing the strategic vision defined by the Holding. It acts as the managing entity of the technological, commercial, and administrative infrastructure of the system, integrating the different functional layers within a coordinated structure.

While the Holding fulfills a strategic and corporate role, the OpCo assumes responsibility for daily execution, technical development, and overall ecosystem operations.

4.1 Nature and Position Within the Architecture

The OpCo is a legally independent entity owned by the Holding, and its function is to operate the digital and commercial environment of the ecosystem.

Within the general structure:



The OpCo does not own the Holding nor the ST; it is a subsidiary and an executing entity.

4.2 Core Functions

a. Development and Operation of the Platform

The OpCo designs, develops, and maintains the technological infrastructure of the ecosystem, including:

- The digital platform.
- Smart contracts.
- Technical integrations.
- User interfaces.
- Security systems.
- Server infrastructure and technological custody systems.

It is responsible for operational continuity and technical maintenance, ensuring the ecosystem functions reliably and securely.

b. Administration of the Index Engine

The OpCo manages the Index as an internal functional engine. This includes:

- Configuration of technical parameters.
- Implementation of operational rules.
- Oversight of internal algorithms.
- Coordination of incentive structures.
- Optimization of structural efficiency.

The Index is not an investment fund; it is an operational tool that organizes internal dynamics within the ecosystem.

The OpCo executes its functionality in accordance with the strategic guidelines defined by the Holding and, where applicable, with decisions approved under the DAO governance model.

c. Administration of the MLM System

The OpCo designs and manages the commercial network of the ecosystem. This includes:

- Definition of the compensation plan.
- Membership management.
- Commission processing.
- Commercial compliance control.
- Oversight of network practices.

The MLM distributes ecosystem products and services, not financial instruments.

The OpCo must ensure that the MLM model remains within legitimate commercial parameters and does not evolve into investment solicitation activities.

d. Execution of the Treasury

The Treasury operates as a corporate reserve, but its operational execution falls under the responsibility of the OpCo. This includes:

- Implementation of approved budgets.
- Allocation of resources for development.
- Liquidity management.
- Operational payments.
- Execution of ecosystem stability strategies.

The OpCo operates under formal treasury management policies and does not act as a third-party fund manager.

e. Implementation of DAO Decisions

Under the defined governance model, the DAO may approve:

- Technical ecosystem parameters.
- Specific budget allocations.
- Expansion proposals.
- Minor structural adjustments.

The OpCo implements such decisions when:

- They are legally compliant.
- They do not contradict the corporate structure.
- They do not compromise regulatory obligations.

The DAO does not replace the legal responsibility of the OpCo; the OpCo retains executive accountability.

4.3 Structural Limits of the OpCo

It is essential to define what the OpCo does not do:

- It does not offer investment products.
- It does not manage third-party capital with an expectation of return.
- It does not operate collective investment funds for users.
- It does not distribute financial instruments.
- It does not act as a regulated asset manager.

The OpCo operates a digital and commercial ecosystem, not an investment fund.

4.4 Responsibility and Compliance

The OpCo is responsible for:

- Applicable regulatory compliance.
- Data protection.
- Technological security.
- Operational transparency.
- Risk management.

It maintains internal policies that clearly separate commercial activities from any activity that could be interpreted as investment management.

4.5 Structural Role Within the Model

The OpCo is the convergence point between:

- Institutional strategy (Holding).
- Technological infrastructure (Index).
- Commercial dynamics (MLM).
- Digital governance (DAO).
- Resource administration (Treasury).

It is the operational axis that connects all layers without altering the legal separation between institutional equity and the utility token.

5. Token DAO (Utility + Governance)

The Token DAO constitutes the digital layer of the ecosystem and fulfills a dual function: an operational utility tool and a structured governance mechanism. Its design responds to the need to finance ecosystem development, enable community participation, and align incentives within the system, without becoming a financial instrument or a representation of corporate ownership.

The architecture of the Token DAO is built upon a fundamental principle: clearly separating the institutional layer (equity) from the digital layer (utility). The token is not a

share, not a negotiable security representing the Holding, and not a unit of participation in a fund.

5.1 Nature of the Token

The Token DAO is primarily a functional instrument within the ecosystem. Its value derives from its structural utility and internal system dynamics, not from third-party capital management.

In its utility dimension, the Token DAO enables:

- Access to services offered by the platform.
- Activation of memberships within the MLM model.
- Interaction with Index tools.
- Participation in incentive mechanisms.
- Integration into the internal economy of the ecosystem.

In its governance dimension, the Token DAO enables participation in structured voting that may influence operational parameters of the system, specific budget allocations, or development proposals. However, this governance is limited and compatible with the existing corporate structure; it does not replace the authority of the Holding nor transfer corporate control rights.

It is essential to establish that the Token DAO does not represent:

- Equity participation in the Holding.
- Rights over the institutional fund.
- Rights to dividends.
- Participation in the Holding's profits.
- Redemption rights against underlying assets.
- Rights to NAV.
- Guaranteed or implied financial returns.

The Token DAO does not constitute an investment instrument and does not grant its holder proprietary rights over underlying assets of the corporate group.

5.2 Token Sale

When a user acquires the Token DAO, they enter into a commercial transaction through which they obtain a digital asset with utility within the ecosystem. The payment made by the user does not constitute a contribution to an investment fund nor a subscription to a financial vehicle.

Funds derived from the sale of the Token DAO become part of the corporate capital administered by the Treasury. At that moment, the capital ceases to economically belong to the purchaser and becomes an operational resource of the ecosystem.

The purchase of the Token DAO:

- Does not create a fiduciary relationship.
- Does not imply individualized capital management.
- Does not grant proportional participation in profits.
- Does not create a contractual expectation of financial return.

The token holder obtains access, utility, and defined governance rights, but does not acquire any right over the specific use of the capital raised nor over the economic results derived from corporate activity.

5.3 Relationship with the Holding and the Fund

The Token DAO operates in a layer completely separate from the institutional ownership structure. There is no automatic conversion between the Token DAO and the Security Token, nor cross-participation between token holders and shareholders of the Holding.

The institutional fund and ST holders do not guarantee, back, or insure the value of the Token DAO. Likewise, the financial performance of the Holding does not automatically transfer to the value of the token.

This separation is structural, legal, and economic, and constitutes one of the core pillars of the model.

5.4 Non-Investment Principle

The design of the Token DAO avoids elements that traditionally define an investment contract, such as:

- A reasonable expectation of profit derived from the efforts of others.
- Proportional participation in returns.
- Direct dependency on the financial performance of the Holding.
- Claims over underlying assets.

The value of the Token DAO derives from utility, adoption, internal ecosystem demand, and the structural growth of the model not from the distribution of financial returns.

6. DAO Treasury

The DAO Treasury constitutes the corporate reserve of the ecosystem and represents the pool of financial resources allocated to ensure its sustainability, expansion, and operational stability. Its existence responds to a logic of prudent management of capital generated through the sale of the Token DAO and operational revenues of the system.

It is fundamental to understand that the Treasury is not a collective investment vehicle nor a mechanism for managing third-party capital. There is no fiduciary relationship between the Treasury and Token DAO holders. The capital administered belongs to the corporate structure and is used for operational and strategic purposes.

6.1 Nature

The Treasury operates as a structural reserve of the ecosystem and fulfills a function of stability and continuity. Its purpose is to finance and sustain the key components of the model, ensuring that technological development, commercial expansion, and operational infrastructure can be maintained over time.

Treasury resources may be allocated to:

- Ongoing development of the technological platform.
- Evolution and improvement of the Index Engine.
- International expansion.
- Marketing and growth of the MLM system.
- Technical integrations and strategic partnerships.

- Internal ecosystem incentives.
- Maintenance of structural liquidity.
- Prudent reserve management.

From a legal and economic perspective, the Treasury does not represent capital proportionally owned by Token DAO holders. The fact that a token has been purchased does not imply that the buyer retains rights over the capital raised.

There is no contractual relationship obligating the Treasury to generate returns, distribute profits, or preserve value in a guaranteed manner.

6.2 Management

The administration of the Treasury is conducted under formal corporate capital management policies. This implies prudence, sustainability, and financial stability criteria.

The Treasury may:

- Maintain reserves in stable digital assets or equivalent low-risk instruments.
- Manage liquidity to ensure continuous operations.
- Allocate capital to development and infrastructure.
- Execute discretionary token buybacks as a structural stability mechanism, provided no contractual obligation or guaranteed expectation exists.
- Finance strategic expansion and ecosystem growth.

It is important to emphasize that any financial management activity performed by the Treasury is carried out as administration of corporate capital, not as management of third-party capital with an expectation of proportional return.

6.3 Structural Limits

To preserve the legal coherence of the model and avoid reclassification as an investment vehicle, the Treasury may not:

- Promise returns to Token DAO holders.
- Establish automatic profit distribution formulas.
- Publish NAV as if representing economic participation.
- Allow proportional redemptions against assets.
- Operate as a retail investment fund.

- Create a contractual expectation of financial benefit derived from its management.

The Treasury has no fiduciary obligation toward token holders in terms of generating returns.

6.4 Separation from the Institutional Fund

If an institutional fund is linked to the Holding, the Treasury remains structurally separate from such fund. There is no commingling of capital nor automatic transfer between the ecosystem's corporate reserve and the assets managed at the institutional level.

The Treasury does not constitute a sub-fund or an extension of the institutional fund. Its function is exclusively operational within the digital ecosystem.

6.5 Sustainability Principle

The purpose of the Treasury is to ensure that the ecosystem can evolve without depending exclusively on new token sales. Proper administration enables:

- Stability during adverse market phases.
- Continuous funding of development.
- Protection against external shocks.
- Structural sustainability of the model.

Under no circumstances is its function to act as a financial return generator for token holders.

7. Index Engine

The Index Engine constitutes the technological core of operational coordination within the ecosystem. It is not a fund, not a collective investment vehicle, and not a third-party capital management system. It is a technological infrastructure designed to structure, execute, and monitor operational processes related to interactions with primary markets through regulated intermediaries.

Its function is to organize the system's technical dynamics and enable structured execution under predefined parameters.

7.1 Technical Nature of the Index

The Index is not a financial instrument in itself. It is a processing, aggregation, and coordination engine that:

- Consolidates operational instructions.
- Standardizes technical parameters.
- Connects with regulated brokers for execution in primary markets.
- Records and displays execution results.
- Automates internal allocation and reporting processes.

Structurally, the Index acts as an intermediate technological layer between the ecosystem's infrastructure and market intermediaries.

It does not custody user assets nor manage individual accounts. Order execution occurs through duly authorized external brokers, who retain regulatory responsibility for market operations.

7.2 Primary Market Operation

When the model requires execution in primary markets, the Index does not act as a financial counterparty. Its function is to:

1. Receive approved operational parameters.
2. Translate them into technical instructions.
3. Transmit orders to authorized brokers.
4. Receive execution confirmations.
5. Display aggregated results within the ecosystem interface.

The Index does not promise outcomes nor control market behavior. It functions as a transmission and visualization engine for execution, not as a return manager.

Primary market activity is executed by regulated intermediaries, not by the platform acting as a financial manager.

7.3 Visualization and Reporting

A key component of the Index is its ability to display operational results in a structured and transparent manner.

This may include:

- Execution confirmations.
- Operational performance metrics.
- Status of executed orders.
- Aggregated information on activity.

It is essential to distinguish between:

Displaying operational results & Promising financial returns.

The Index provides technical visibility into executed processes; it does not create a contractual expectation of profit.

7.4 Structural Function Within the Ecosystem

The Index fulfills critical roles within the model:

- Optimizes resource allocation within the system.
- Coordinates structural liquidity.
- Integrates approved technical parameters.
- Enhances operational efficiency.
- Reduces execution friction.

Its purpose is to strengthen ecosystem architecture, not to act as a hedge fund or collective investment vehicle.

7.5 Structural Regulatory Limits

To preserve its technical nature, the Index:

- Does not manage individual user accounts.
- Does not manage capital under personal investment mandate.
- Does not distribute proportional returns.

- Does not guarantee results.
- Does not publish NAV as a financial instrument.
- Does not operate as a collective fund.

Market interaction occurs exclusively through regulated brokers who assume execution responsibility in accordance with applicable regulations.

7.6 Differentiation from an Investment Fund

An investment fund:

- Pools third-party capital.
- Manages it with an expectation of return.
- Distributes proportional results.

The Index:

- Coordinates technical execution.
- Operates as infrastructure.
- Displays operational results.
- Does not create a fiduciary relationship with users.

The distinction is substantial and structural.

7.7 Strategic Role

The Index is the component that allows the ecosystem to achieve operational sophistication without transforming into a regulated financial vehicle.

Its value lies in:

- Technical efficiency.
- Operational transparency.
- Integration with authorized intermediaries.
- Technological scalability.

Not in the promise of financial returns.

8. MLM Model Integrated with the Token DAO (45% Allocation Model)

8.1 Economic Principle of the Model

The MLM system does not distribute investment returns or financial yield. It distributes commercial incentives derived from the sale of the Token DAO and associated memberships.

When a Token DAO sale occurs, the total revenue is structurally allocated into two primary blocks:

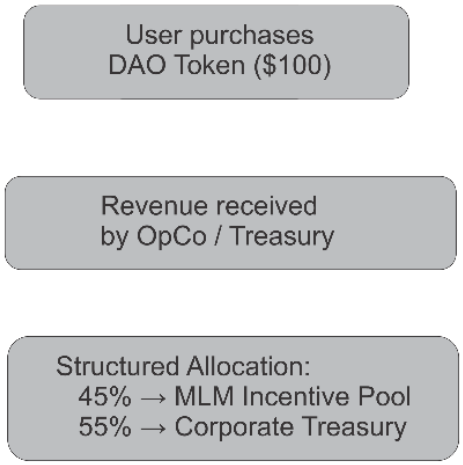
- 45% allocated to the MLM Incentive Pool.
- 55% allocated to the Corporate Treasury.

This allocation is a commercial distribution policy, not an investment structure.

8.2 Economic Flow

Assume a user purchases the Token DAO for USD 100.

The flow would be:



The 45% portion is not capital invested in the market.
It is a commercial compensation budget.

8.3 Nature of the 45% Allocation

The 45% allocation serves the function of:

- Funding network commissions.
- Paying volume-based bonuses.
- Incentivizing commercial expansion.
- Rewarding legitimate performance.
- Sustaining hierarchical levels under an Amway-style structure.

It does not represent:

- Participation in a fund.
- Participation in financial returns.
- Capital that must “work” to generate ROI.
- Proportional distribution of profits.

It is a commercial margin allocated to the network.

8.4 Proper Application of Amway-Style Logic

In Amway:

- A product is sold.
- Part of the revenue finances the network.
- Part finances the company.
- There is no promise of financial return.

In this model:

- The Token DAO (utility) is sold.
- Part of the revenue finances the network.
- Part finances development and sustainability.
- No financial return is distributed.

The model is commercial, not financial.

8.5 Structural Sustainability

For the 45% allocation to be sustainable:

- There must be a real product (membership + utility).
- There must be renewal or consumption dynamics.
- It must not depend exclusively on new sales.
- The Index must provide independent functional value.

If the only revenue source is continuous new token sales without real usage or consumption, the model becomes structurally fragile.

8.6 Relationship with the Index

The Index:

- Does not generate commissions.
- Does not finance the 45% allocation.
- Is not obligated to produce returns to sustain the network.

Commissions are paid based on sales volume, not market performance.

This distinction is critical.

8.7 The 55% Allocation to the Treasury

The 55% allocation is designated to:

- Fund development.
- Maintain liquidity.
- Support infrastructure.
- Finance marketing.
- Enable expansion.
- Build strategic reserves.

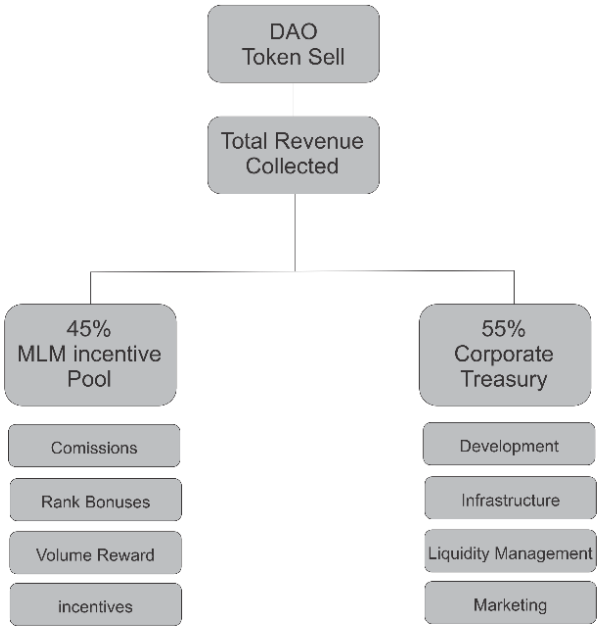
It is not mixed with the 45% allocation.
It is not used to cover commissions in the absence of sales.
It is not a collective investment fund.

8.8 Final Integrated Architecture

The final integrated structure operates under a layered and economically separated architecture:

- Institutional capital (ST + Fund) operates at the equity level within the Holding.
- The Operating Company executes technology, MLM, and Treasury operations.
- The Index provides operational coordination without becoming a financial vehicle.
- The Token DAO enables utility and limited governance.
- 45% of Token DAO sales finance the commercial network.
- 55% of Token DAO sales sustain corporate development and ecosystem stability.

Each layer fulfills a distinct function, and none substitutes the role of a regulated investment structure. The model remains a technology-driven ecosystem with a structured commercial network, supported by institutional governance and corporate capital discipline



The model operates as a commercial enterprise with a multi-level distribution structure.

8.9 Critical Regulatory Point

For the model to remain legally defensible, several structural conditions must be strictly maintained. The Token DAO must have real, functional utility within the ecosystem and must not be marketed or positioned as an investment opportunity. It must not promise financial returns, nor be linked explicitly or implicitly to the performance of the Index. Additionally, commissions within the MLM structure must depend exclusively on legitimate commercial volume derived from product or service sales.

If the token is promoted as an “investment opportunity,” the nature of the model changes fundamentally. The classification risk shifts from a technology-driven commercial ecosystem to a potential investment scheme. The integrity of the structure therefore depends not only on legal design but also on disciplined communication and operational consistency.

9. Layered Separation

The model is structured into clearly differentiated functional layers, each with defined responsibilities, limits, and levels of interaction. This separation is not merely organizational; it is legal and economic. It constitutes one of the essential pillars for preserving structural coherence and preventing overlap between institutional capital, technological operations, and retail participation.

9.1 Institutional Layer (Equity Layer)

The institutional layer consists of the Security Token (ST) and the fund shareholder of the Holding. This layer represents the ownership and corporate control structure of the group.

The ST constitutes equity participation in the Holding and grants corporate rights in accordance with the applicable bylaws. The fund participates as a strategic investor within the same Holding.

Neither instrument interacts with retail. They are not commercialized through the MLM, do not form part of the Token DAO, and are not distributed within the ecosystem.

Their function is strictly institutional, oriented toward corporate governance, strategic oversight, structural stability, and long-term alignment. The institutional layer operates entirely isolated from the retail environment.

9.2 Holding Company

The Holding acts as the parent entity and strategic control body. It defines long-term guidelines, supervises the Operating Company, and safeguards the system's architecture.

It does not directly interact with end users. It does not sell tokens, distribute memberships, or manage retail capital. Its role is exclusively strategic and corporate.

9.3 Operating Company (OpCo)

The Operating Company is the operational arm of the ecosystem. It develops the platform, administers the Index, coordinates the MLM, and executes Treasury management.

Although the OpCo interacts indirectly with retail through the platform and services it does not do so as an investment manager or financial intermediary. Its interaction is operational and commercial in nature.

9.4 Token DAO

The Token DAO constitutes the utility and governance layer of the ecosystem. It is the only digital instrument distributed directly to retail.

It enables access to services, activation of memberships, participation in voting processes, and interaction with ecosystem tools.

It does not grant equity participation, rights over the fund, dividend rights, rights to NAV, or proportional participation in profits. It is a functional and structured participation tool, not an investment instrument.

9.5 Treasury

The Treasury represents corporate capital administered for ecosystem development and sustainability.

Although it is financed by revenues from Token DAO sales and memberships, it does not represent capital proportionally owned by token holders.

There is no redemption right, no proportional distribution right, and no direct participation in financial results. The Treasury does not interact with retail as a fund but as an internal corporate reserve.

9.6 Index Engine

The Index is technological infrastructure enabling coordinated operational execution and display of technical results derived from interactions with regulated brokers.

Users may utilize the Index as a functional tool within the ecosystem, but they do not participate as investors in a fund managed by the Index. The interaction with retail is functional, not financial.

9.7 MLM

The MLM constitutes the commercial network of the system and is the primary layer of direct retail interaction.

It distributes memberships, ecosystem access, and technological tools. Commissions are paid based on legitimate commercial volume derived from the sale of products and services. They are not paid for recruitment without product nor for financial performance.

9.8 Functional Isolation Principle

The complete architecture can be understood as three major blocks:

1. Institutional Layer (ST + Fund + Holding)
2. Operational Layer (OpCo + Index + Treasury)
3. Commercial/Utility Layer (Token DAO + MLM)

Each block fulfills a specific function and maintains defined boundaries to prevent economic or legal overlap.

This separation allows the model to maintain structural coherence, avoid reclassification as a retail investment fund, preserve independence between institutional capital and utility token, and sustain a legitimate commercial system.

10. Principle of Economic Separation

The principle of economic separation forms the foundation that allows the Token DAO to maintain its utility and governance nature without transforming into a financial instrument or indirect participation in the institutional structure.

This separation is substantive, not merely formal. It means that the ecosystem's layers equity, technological operation, commercialization, and token utility function under distinct and non-interchangeable economic logics.

10.1 Absence of Direct Financial Link Between the Holding and the Token DAO

The Holding operates exclusively within the institutional layer. Its revenues, assets, and financial results belong to shareholders represented by the ST and, where applicable, the institutional fund.

The Token DAO does not represent participation in the Holding nor grant economic rights over its assets or profits. There is no automatic correlation between the Holding's financial performance and the value of the Token DAO.

The growth of the fund does not automatically increase token value. Holding profits are not distributed to token holders. Token holders have no claim to institutional financial reporting beyond what may be strategically disclosed.

The relationship between both layers is structural, not proprietary.

10.2 No Distribution of Fund Performance

The institutional fund, if present, participates at the equity level of the Holding. Its results belong to Holding shareholders under applicable agreements.

There is no mechanism through which the fund's performance is transferred, directly or indirectly, to Token DAO holders.

The Token DAO does not grant dividend rights, proportional profit participation, access to asset-management returns, or redemption rights against institutional assets.

This boundary is essential to prevent the token from being interpreted as indirect representation of a financial instrument.

10.3 The Token DAO Does Not Represent Participation in the Index

The Index Engine is technological infrastructure operated by the Operating Company. Its function is structural and operational.

The Token DAO does not represent equity participation in the Index, entitlement to operational returns, percentage rights over technical results, or participation in managed accounts.

The fact that a user utilizes the Index does not make them an economic beneficiary of its operations. The token's value derives from utility, not from market results.

10.4 The Treasury Manages Corporate Capital

When the Token DAO is sold, the funds raised become corporate capital within the ecosystem. They cease to belong economically to the purchaser and become integrated into the operational structure administered by the OpCo under Holding supervision.

The Treasury does not manage third-party capital under fiduciary mandate. There are no individualized fund accounts, no proportional asset rights, and no contractual expectation of financial return.

The Treasury manages its own resources for development, expansion, operational stability, and structural liquidity. It does not operate as a collective investment fund.

10.5 Importance of the Separation Principle

This principle preserves the utility nature of the Token DAO, prevents regulatory reclassification as a financial instrument, separates institutional responsibility from retail interaction, maintains legal coherence between layers, and reduces international regulatory risk.

It is this clarity that differentiates a technology-commercial ecosystem from a collective investment scheme.

11. Governance

The model adopts a hybrid governance framework that combines decentralized participation through the Token DAO with institutional control through the Holding and its Board. This architecture balances operational efficiency, community participation, and strategic stability.

Governance is neither fully decentralized nor fully centralized. It is layered, with clearly defined competencies.

11.1 Hybrid Model Structure

Governance operates across three levels:

1. DAO (limited operational governance)
2. Holding Board (institutional strategic governance)
3. Operating Company (operational execution)

Each level fulfills a complementary function.

11.2 Role of the DAO

The DAO represents structured participation within the ecosystem. Token DAO holders may vote on operational parameters and proposals affecting system functionality.

The DAO may influence technical adjustments to the Index, incentive parameters, specific Treasury allocations, new features, and non-structural operational modifications.

However, it cannot modify the Holding's corporate structure, alter ST holder rights, dispose of institutional assets, contradict regulatory obligations, or transform the model into a financial instrument.

DAO governance is operational and programmatic, not corporate.

11.3 Role of the Holding Board

The Holding Board maintains strategic authority over the entire ecosystem. It defines long-term vision, approves structural expansions, supervises regulatory compliance, appoints and oversees the Operating Company, and protects institutional interests.

While it does not intervene in minor operational votes, it retains veto power over decisions that could compromise legal or strategic integrity.

11.4 Role of the Operating Company

The OpCo acts as the executive entity. It implements DAO-approved decisions when legally viable, executes strategic directives from the Holding, operates the Index technically, administers the MLM, and manages the Treasury.

The OpCo retains legal responsibility toward third parties and cannot execute decisions that violate applicable regulations.

11.5 Functional Hierarchy

The relationship between the three governance layers can be understood as a structured hierarchy of authority and execution, where each level operates within defined boundaries.

At the top, the Holding Board exercises strategic authority. It defines long-term direction, protects institutional interests, and ensures that the ecosystem remains aligned with its legal and structural framework. Its role is not operational but supervisory and strategic.

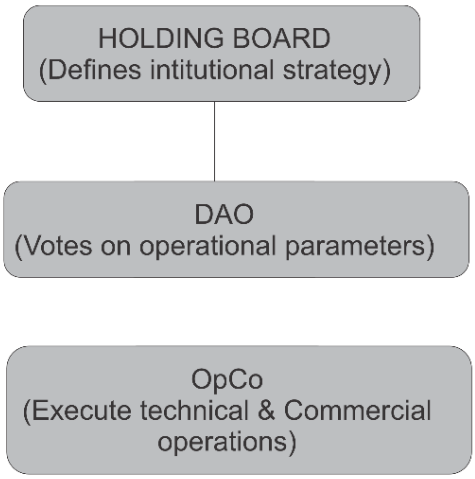
At the intermediate level, the DAO provides structured operational participation. It may influence defined parameters of the ecosystem, propose improvements, and vote on certain non-structural matters. However, its authority is limited to operational governance and does not extend to corporate control or institutional assets.

At the execution level, the Operating Company (OpCo) implements both strategic directives from the Holding and operational decisions approved under the DAO framework, provided they are legally compliant and consistent with the corporate structure.

In simplified structural terms:

- The Holding Board defines strategy.
- The DAO influences operational parameters within predefined limits.
- The OpCo executes technical and commercial operations.

This functional hierarchy ensures balance between decentralization and institutional stability. It prevents governance fragmentation while allowing participatory input, maintaining legal responsibility clearly within the corporate structure.



The DAO influences; the Board defines; the OpCo executes.

11.6 Structural Limits of Decentralization

It is essential to establish that the DAO does not replace the legal structure of the Holding. The ecosystem does not transform into a purely decentralized entity. Legal personality and regulatory obligations remain within the institutional layer.

Decentralization is functional and operational, not corporate or financial.

This prevents:

- Legal confusion regarding responsibility.
- Regulatory gaps.
- Risk of classification as a community-managed investment fund.
- Strategic instability.

11.7 Balance Between Decentralization and Control

The hybrid model enables:

- Genuine community participation.
- Transparency in operational parameters.
- Technological flexibility.
- Institutional stability.
- Protection against impulsive or destabilizing decisions.

It is structured decentralization, not absolute decentralization.

12. Global Operation

The model is designed to operate across multiple jurisdictions under a digital commerce and technological service framework, not as a financial investment structure. Its capacity for international expansion depends on maintaining legal coherence and strictly preserving separation between utility, institutional equity, and regulated financial activity.

Global operation does not mean absence of regulation; it means correct classification of the model within applicable legal frameworks in each jurisdiction.

12.1 No Sale of Financial Instruments to Retail

A fundamental condition for global operation is that the Token DAO and associated memberships are not presented or structured as financial instruments.

The model may not:

- Offer securities to the public.
- Distribute instruments representing equity participation.
- Promise financial returns.
- Advertise expectations of profit derived from third-party management.

As long as the Token DAO maintains its nature as a utility and limited governance instrument, the ecosystem may be classified as a technology platform with a commercial model.

12.2 No Distribution of Holding Participation

The institutional layer (ST + Fund + Holding) remains isolated from the retail environment. Participation in the Holding is not offered to the general public, nor is conversion permitted between the Token DAO and institutional equity.

This separation is essential to avoid interpretation as a public securities offering in sensitive jurisdictions. The Holding maintains its private and institutional character.

12.3 No Management of Third-Party Capital

The ecosystem cannot operate globally as a third-party capital manager without specific licenses.

To preserve international operation as a technological platform:

- Individual funds must not be administered under fiduciary mandate.
- Segregated accounts with expectation of return must not be managed.
- There must be no pooling of capital with proportional participation.

The Treasury administers corporate capital, not capital economically belonging to users.

12.4 Respect for Geographic Restrictions

Even if the model is utility-based and commercial, it must respect:

- Jurisdictions restricting token sales.
- Countries with strict MLM regulations.
- Territories with specific digital asset rules.
- Applicable KYC/AML requirements.

Global operation implies implementing compliance filters, not ignoring them.

12.5 Interaction with Regulated Brokers

When the Index interacts with brokers to execute primary market operations, such interaction occurs through intermediaries regulated in their respective jurisdictions.

Regulatory responsibility for market execution rests with the authorized broker, not with the platform as a financial manager.

This enables:

- Structured access to markets.
- Operational transparency.
- Clear separation of responsibilities.

12.6 International Scalability

The model can scale globally under three pillars:

1. Classification as a technological and commercial platform.
2. Absolute separation between utility and equity.
3. No management of third-party capital with expectation of return.

As long as these principles are maintained, international expansion may be structured through:

- Local subsidiary entities.
- Jurisdiction-specific contractual adaptation.
- Proportional AML/KYC compliance.
- Access limitations in restricted territories.

13. Conclusion

The developed model integrates, in a structured and coherent manner, five fundamental dimensions: institutional capital, technological infrastructure, commercial network, digital governance, and corporate resource management. Each layer fulfills a specific and delimited function, preventing economic or legal overlap.

The architecture enables the coexistence of:

- A solid institutional layer composed of the Security Token (ST) and a strategic fund within the Holding.
- A decentralized financing mechanism represented by the Token DAO, whose function is to enable utility and governance without representing equity participation.
- A technological operational engine, the Index Engine, which coordinates structured execution without becoming an investment fund.
- A scalable commercial expansion system through an Amway-style MLM model based on legitimate sale of products and services.
- A structured corporate Treasury oriented toward sustainability, development, and operational stability.

The coherence of the model rests on strict separation between the institutional equity layer and the Token DAO utility layer. This separation is structural, legal, and economic.

The Token DAO does not represent participation in the Holding, does not grant rights over the institutional fund, and does not provide access to dividends, NAV, or proportional returns. Its value derives exclusively from its utility within the ecosystem and its role in operational governance.

The architecture avoids classification of the Token DAO as a financial instrument provided that three fundamental principles are maintained:

First, there must be no reasonable expectation of financial return derived from third-party management.
Second, there must be no proportional distribution of profits nor economic rights over underlying assets.
Third, user capital must not be administered as investment under fiduciary mandate.

As long as these principles are respected, the model may be classified as a technology-commercial ecosystem with a digital governance component, rather than as a collective investment vehicle.

In summary, the design combines structural sophistication with legal discipline, enabling global growth, institutional integration, and commercial expansion without compromising the utility nature of the Token DAO or the separation between institutional capital and retail participation.

The strength of the model does not lie in absolute decentralization nor in traditional centralization, but in the precise delimitation of responsibilities and in a layered architecture that preserves coherence, sustainability, and scalability.
